G. OTHER LOCATIONS AS REQUIRED BY THE ARCHITECT AND INDUSTRY STANDARDS.

SEE DETAILS BELOW FOR TYPICAL PARTITION CONSTRUCTION INFORMATION.

ACOUSTICAL ASSEMBLIES

INTERNAL SOUND ISOLATION MUST BE MAINTAINED BETWEEN SELECT INTERIOR SPACES. THE PARTITIONS BETWEEN THESE SPACES ARE DESIGNATED AS 'ACOUSTICAL ASSEMBLIES' OR 'ACOUSTICAL CHASE' IN THE DETAIL DESCRIPTIONS OF PARTITION TYPES ON THE SHEET. ACOUSTICAL ASSEMBLIES ALWAYS EXTEND FROM FLOOR TO THE UNDERSIDE OF DECK ABOVE WITH THE WALLBOARD EXTENDING THE FULL HEIGHT.

THE ACOUSTICAL ASSEMBLIES AT SOUND CRITICAL PARTITIONS FOR THIS PROJECT ARE AS FOLLOWS:

- ALL PARTITIONS IDENTIFIED AS SUCH IN THE TYPES ON THIS SHEET
- HAVING THE MODIFIER 'a' IN THE PLAN TAG WHICH INDICATES ACOUSTICAL INSULATION BLANKET IN THE PARTITION.
- ALL INTERIOR CMU WALLS.

ALL PENETRATIONS THROUGH ACOUSTIC ASSEMBLIES ARE REQUIRED TO BE ACOUSTICALLY PROTECTED PER DETAILS ON SHEETS MXXX, MXXX, EXXX, PX.XX, FAXXX, AND TXX.

ALL ACOUSTICAL ASSEMBLIES ARE TO RECEIVE SEALING @ THE TOP END AS FOR FIRE RATED ASSEMBLIES AS INDICATED IN DETAILS X.X, & X.X ON AXXX.

DELAYED EGRESS LOCKING SYSTEM NOTES:

1. The delay electronics of the delayed egress locking system shall deactivate upon actuation of the automatic sprinkler system or automatic fire detection system, allowing immediate, free egress.

2. The delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.

3. The delayed egress locking system shall have the capability of being deactivated at the fire command center and other approved locations.

4. An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds. Initation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only.
Exception: Where approved, a delay of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system.
Exception: In Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware:

6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.

6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS.

6.3. The sign shall comply with the visual character requirements in ICC A117.1.
Exception: Where approved, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.

7. Emergency lighting shall be provided on the egress side of the door.

8. The delayed egress locking system units shall be listed in accordance with UL 294.

M. SEISMIC BRACES ARE NOT REQUIRED FOR DISTRIUBTION SYSTEMS WEIGHLING LESS THAN 5#/LF.
O. SEISMIC BRACING IS NOT REQUIRED IF HIGH-DEFORMABILITY PIPING IS USED, PROVISIONS ARE MADE TO AVOID IMPACT WITH LARGER PIPING OR MECHANICAL COMPONENTS OR TO PROTECT THE PIPING IN THE EVENT OF SUCH IMPACT, AND:
   - FOR SEISMIC DESIGN CATEGORY D, E OR F WHEN IP=1.0 AND THE PIPING IS NOMINAL PIPE SIZE 3" OR SMALLER.
   - FOR SEISMIC DESIGN CATEGORY D, E OR F WHEN IP=1.5 AND THE PIPING IS NOMINAL PIPE SIZE 1" OR SMALLER.

HIGH-DEFORMABILITY PIPING INCLUDES WELDED STEEL, BRAZED, SOLDERED, THREADED, OR GROOVED COUPLING COPPER.
P. PER ASCE 7, PIPING MOUNTED ON TRAPEZE SUPPORTS DOES NOT NEED TO BE DESIGNED FOR SEISMIC LOADS OR
DISPLACEMENTS IF NO SINGLE PIPE EXCEEDS THE 5#/LF SIZE LIMIT AND THE TOTAL WEIGHT OF THE SYSTEM DOES NOT EXCEED 10#/FT.

PROJECT OVERVIEW

Project Address: 1400 E Prospect St

The intent of this project is to upgrade the Volunteer Park Asian Art Museum facility to a present day world class conservation environment consistent with the preservation of valuable art pieces while offering presentations in an artful and safe manner. Improvements planned will include structural upgrades, building envelope insulation and moisture barrier, heating, cooling, humidity control, air distribution and electrical infrastructure upgrades. HVAC and Plumbing equipment will be demolished and replaced with new energy efficient systems compatible with maintaining a quality environment consistent with art preservation requirements.

DIVISION 23 – HEATING, VENTILATION, AND AIR CONDITIONING

230505 – Basis of Design Narrative for HVAC
General: Section includes Basis of design and performance criteria for mechanical systems.

Product:

2015 Seattle Energy Code Compliance: Determination of Conformance Requirements.
- The renovation and addition project is classified as a substantial alteration.
- The building has Landmark status.
- A presubmittal conference is scheduled with Seattle DCI to determine the extent of compliance required based on the building's landmark status and the substantial alteration classification.
- 2015 SEC C501.6 Historic Buildings – The code official may modify the specific requirements of this code for landmarks and require in lieu thereof alternate requirements that the code official determines will not have an adverse effect on the designated historic features of the building and will result in a reasonable degree of energy efficiency.
- 2015 SEC C503.8 Substantial alterations or repairs. In addition to meeting the applicable requirements of this code, any building or structure to which substantial alterations or repairs are made shall comply with the requirements of this section. 2015 SEC C503.8 Exceptions: 1. Alterations and repairs to landmark buildings shall comply with this section to the extent that the code official determines that such compliance does not have an adverse effect on the designated historic features of the building. The energy use allowed by subsections 2, 3 or 4 of Section C503.8.3 is permitted to be increased in proportion to the additional energy use required for preservation of such designated features
- 2015 SEC C503.8.3 Energy Efficiency. Compliance pathway for Substantial Alteration portion of the building. Option 3. Total building performance within 10 percent of code. Demonstrate that the building energy consumption will be less than 10 percent higher than that of the standard reference design (SRD) using the Total Building Performance methodology in Section C407 of the Seattle Energy Code, as follows.
1. It shall comply with less than 97 percent of SRD, because no C406 options are included in the SRD.

2015 Seattle Energy Code Compliance C409 Metering:
- C409.1 General. Buildings with a gross conditioned floor area over 20,000 square feet shall comply with Section C409. Buildings shall be equipped to measure, monitor, record and display energy consumption data for each energy source and end use category per the provisions of this section, to enable effective energy management.
- The meter data procurement is by the BMS. The EC shall provide a single point of connection at each panel for connection to the BMS by the MC. The BMS will store data from all electrical meters for 36 months. The data acquisition system shall provide real-time energy consumption data as well as logged data for any hour, day, month or year per C409.4.2. The information shall be displayed on a building management computer provided by the MC for the BMS, and is required to display current energy consumption for whole building energy, plus each end use category, as well as the average and peak values for any day, week, or year.
- The PC will provide a gas meter for the gas fired HVAC Boiler plant. The data acquisition system will capture data direct from the gas meter.

2015 Seattle Energy Code Compliance C411 Renewable Energy:
- The heat recovery chiller will be utilized as a primary heating source during the extended periods of simultaneous heating and cooling. The C407 study will be utilized to demonstrate compliance with Exception 2: Additional heat recovery systems beyond those required by this code are permitted to be provided in lieu of on-site renewable energy systems, where the calculated net annual energy savings from the heat recovery systems exceed the calculated net annual energy production of the required on-site renewable energy systems.

2015 Seattle Energy Code Compliance C406 Additional Efficiency Package Options: Because no C406 Options have been included for the Addition portion of the building, in lieu of complying with C406, the C407 model shall comply with less than 87 percent of the SRD, because no C406 options are included in the SRD.

Design Criteria – Weather Conditions
- Weather conditions are based upon ASHRAE Fundamentals Handbook, 2005 edition. ASHRAE data is taken from Seattle Boeing Field weather station data compiled from 1982 through 2001.
  - Summer: 0.4% DB / MCWB :
    Design dry bulb: 86°F
    Design wet bulb: 66°F
  - Winter:
    Design dry bulb: 12°F (19°F + 15% SF)
    Relative Humidity 49%

Indoor Environmental Requirements
- General criteria are per the following table. Additional specific spaces will be added as needed throughout BOD development.

Space	Temperature				Humidity		
	Winter	Summer	Unoccupied Mode	Maximum Rate of Change	Winter	Summer	Maximum Rate of Change
Spaces with Limited Temp Control	>50°F	<85°F	50-105°F	NA	NA	NA	NA

Requirements for Ventilation Air Quality
- Gas Phase filtration shall be provided for the full supply air quantity of HVAC systems serving spaces with art.
- The ideal location for gas filtration is in a mixed air position and, to achieve maximum protection, the media should be positively pressurized by locating it downstream of the supply fan. Due to space constraints the media may be on the negative side of the fan given strict cabinet leakage criteria.
- OUTSIDE AIR: Treatment of the outside air is usually to remove inorganic acid-gases, such as sulfur dioxide and oxides of nitrogen; this is usually done with reaction with a caustic base, such as potassium permanganate or carbon with potassium hydroxide. Outside air must also be treated to remove ozone; ozone is usually catalyzed to oxygen with contact with carbon.
- RECIRCULATED AIR: Treatment of recirculated air is usually to remove volatile organic compounds (VOCs) and ozone. Depending on the compounds to be removed, this indicates the possible need for carbon, treated carbon, and/or again, a caustic base, such as potassium permanganate.
- The results of product research work done for the downtown museum expansion project will be utilized in the SAAM. Filter model to be provided is Aerostar HEGA Filters Series 3651. The HEGA shedding cube cover will be provided and installed in the same face loaded filter frame.
- Relative Humidity of Filtered Air – Media should be located in the air stream where they can be expected to be at 30 to 60% RH.
- Protecting Gaseous Media from Humidification Drift of Cooling Coil Carryover – The humidifier and cooling coil should preferably be located downstream of the gaseous media, or well upstream
- An air quality sampling station such as that provided for the downtown museum will be provided. Performance of the downtown installation will be evaluated prior to finalizing this approach.

- The following table defines contaminant control limits.

- In no case should supply air be blown directly on the collections in display or storage. This includes avoiding the practice of delivering supply air across walls where collections might be displayed.
- The liberal use of open "through the room" return air for collection spaces should be avoided. Wherever possible, ducted return air should be provided to general areas.
- Avoid locating equipment requiring service above any collection areas.
- Select air grille locations to ensure proper air flow and diffusion, to avoid stagnant air pockets, and to avoid blowing supply air or drawing return air over collections.
- Do not use return air plenums at exterior walls if not fully contained within the building envelope.
- Avoid internally-lined ducts and equipment. Encapsulated lining w/ perf inner duct wall is allowed if alternate attenuation approaches cannot be accommodated.

- All filter frames shall be Type 8 front loading.
- Provide a P-cone or full-flow transverse flow measuring station located in the filter or coil section with external gauge showing airflow in cfm. Devices at the fan inlet are not acceptable. Transmitter shall be provided by the EMCS Contractor.
- Provide a second flow measuring station in the outside air section(s). Transmitter shall be provided by the EMCS Contractor
- Provide corrosion sensing device for installation in occupied space for each AHU for monitoring effectiveness of gas phase filters. Real time corrosion sensors shall be provided that can accurately gage media effectiveness without requiring periodic air sampling. These shall be provided with an automatically monitored DDC input so the building operators can be alarmed automatically if effectiveness drops.

AHU-L1-1, AHU-L1-2, AHU-L1-3 Economizer

- Outside air economizer is required as the gas phase filtration exception was eliminated in the 2009 code cycle.
- Outside air intake and relief air sizing are to allow for 100% outside air usage for the 1/13/2017 set.

- If economizer is utilized, the gas phase filtration is expected to load more rapidly. Reliable air quality monitoring and differential pressure sensing will be required in order to establish a reliable filter change out schedule.
- Since the building is to be provided with humidification control, airside economizer control will be based on both dry bulb and humidity ratio.
- Outdoor sensor reliability is of high importance and so sensor redundancy is required.
- Relative Humidity of Filtered Air – Media should be located in the air stream where they can be expected to be at 30 to 60% RH.
- Space temperature and RH stability is of primary importance.

239400 - Humidification

General: Electric Steam humidifiers

Product: Materials

Duct Requirements

- Duct sections containing humidifier elements shall be stainless steel for up to 6 feet or 6 times the absorption distance, whichever is greater.
- Duct sections containing humidifier elements shall have drain connections and piping, trapped and routed to indirect waste receptacle.
- Duct access doors with viewports shall be provided at all duct humidifier elements.
- Provide dispersion tube type that will accommodate short dissipation distances with multi tube dispersion manifolds.

Water requirements

- A minimum water pressure of 35 psi should be maintained to provide the proper water level within the humidifier. Maximum pressure allowed is 60 psi.
- Humidifier non potable water will include 10 micron filtration, and a water softener.

Dri-Steem Vapormist humidifiers

- Steam created in the evaporating chamber flows through steam hose, tubing, or piping to the dispersion assembly, where it is discharged into the airstream using insulated high-efficiency stainless steel dispersion tubes. The DI/RO units feature a mechanical float for water level control and a low water stainless steel probe and cutoff switch. Use of the mechanical float in lieu of a level probes will reduce the frequency drain cycles, and create more stable humidity control. Field testing of the museum's water quality will be performed by the humidifier vendor and will confirm whether the DI/DO units can be used.
- A control panel with a microprocessor controller mounted on the panel door constantly monitors the humidifier cycle for efficient operation. The microprocessor controller also provides a LED display to indicate the status of the humidifier. High efficiency immersion electric water heater elements heat the water to provide steam.
- A real-time clock schedules automatic draining and flushing, thus reducing mineral build-up within the reservoir.
- The humidifier shall have an evaporating reservoir with a gasket-sealed cover that is capable of operating at pressures of at least 19" (48 cm W.C.) without steam or water leaks. The reservoir shall be made of type 304 stainless steel with welded joints.
- A brass body, solenoid operated water fill valve shall be factory-mounted on the cover of the humidifier reservoir. The fill valve shall be located to allow a minimum air gap of

1-1/2" (3.81 cm). An inline strainer shall be factory-mounted on the fill valve to remove any water-born particulate matter before the humidifier fill valve. The water strainer shall have a removable screen to permit periodic inspection and cleaning.

- A Vapor-logic Version 6 microprocessor control module shall be factory-mounted on the cover and shall the following capabilities: communication with building automation systems via BACnet®, Web interface, direct or remote set up, monitoring, and control, USB port, PID control allows, real-time clock, programmable outputs, enhanced diagnostics, and an auxiliary temperature sensor for temperature compensation to prevent condensation at locations e.g. windows and/or ducts.
- SCR Modulation. Provides 0-100% power modulation of the heater outputs down to a one-second cycle rate. A compatible humidity sensor shall be shipped loose for field installation (±1-2% RH).
- Air Flow Proving Switch. A diaphragm-operated air flow proving switch with adjustable control range of .05" W.C. to 12.0" W.C. shall be provided for field installation. Switch rating shall be 2.5 amps at 120V. Duct High-Limit. A high-limit humidistat shall be provided for duct installation. The high-limit shall be field set to prevent over saturation within the supply duct.

SPECIAL BALANCE NOTES:

GENERAL

THE FOLLOWING NOTES ARE PROVIDED AS PLUMBING, MECHANICAL AND MECHANICAL PIPING SCOPE REQUIRED FOR SPECIAL TEST AND BALANCE REQUIREMENTS. PLEASE NOTE THAT THIS IS NOT A COMPLETE TEST AND BALANCE PROCEDURE. THE TESTING ADJUSTING AND BALANCING (TAB) CONTRACTOR SHALL SUBMIT A TESTING PROCEDURES DRAFT REPORT, DECRIBING IN GREATER DETAIL WHO THEY WILL WORK WITH AND HOW THEY WILL ACCOMPLISH THE REQUIREMENTS INCLUDED HEREIN.

SEE THE DESCRIPTION OF OPERATIONS, SPECIFICATIONS, AND 2015 SEC FOR FURTHER INFORMATION ON TEST AND BALANCE REQUIREMENTS.

AHU'S:

1. SEE DESCRIPTION OF OPERATIONS FOR OUTSIDE AIR BALANCING PROCEDURE.
2. THE DESIGN HERTZ FOR THE AHU VFDS ARE ABOVE 60 HERTZ (~60-100 HERTZ) SO NEED TO MAKE SURE THESE DRIVES ARE NOT LIMITED TO 60 HERTZ.
3. AIRFLOW MONITORING STATIONS:·REPORT CALIBRATION MULTIPLIER OR K-FACTOR FOR EACH AIR MEASURING STATION. AFTER CALIBRATION MULTIPLIER IS INPUT INTO THE BMS, RETURN TO VERIFY THE MAX AND VERIFY MIN SETPOINT.·REPORT AIR MEASURING UNITS THAT ARE ABNORMAL. INSPECT AIR MEASURING UNIT AND DAMPER INSTALLATIONS.
4. TAB CONTRACTOR TO DETERMINE MINIMUM FAN SPEED, AND PRESSURE SETTING THAT CORRESPONDS TO MINIMUM REQUIRED AIRFLOW PER THE SUM OF THE MIN PRIMARY AIRFLOWS FOR THE VAVS ON EACH CORRESPONDING AHU.

OPERATIONAL MODES FOR BUILDING PRESSURIZATION:

1. GO THROUGH ALL FIVE SCENARIOS ON THE AIR BALANCE SCHEDULE: ECONOMIZER ON/OFF IN OCCUPIED MODE, ECONOMIZER ON/OFF IN UNOCCUPIED MODE, AND EMERGENCY POWER SETBACK MODE AND PRIOR TO THE FINAL REPORT SEND A DEFICIENCIES REPORT DETAILING PROPOSED SETTING AND BUILDING PRESSURES. WORK WITH THE CONTROL CONTRACTOR AND COMMISSIONING AGENT TO MODIFY LIMITS TO THE VARIOUS FAN SPEEDS AND DAMPER POSITION LIMITS. TESTING FOR THE FINAL REPORT SHALL INCLUDE BUILDING PRESSURES AND FINAL LIMITS FOR ALL FIVE SCENARIOS.
2. TAB CONTRACTOR TO DETERMINE MINIMUM AND MAXIMUM FAN SPEEDS THAT CORRESPONDS TO MINIMUM REQUIRED AIRFLOW PER RELIEF AND RETURN FAN SCHEDULES.

VAV BOXES:

1. FOR SINGLE DUCT VAV BOXES:·BALANCE DIFFUSERS AT MAXIMUM AIRFLOW.·REPORT CALIBRATION MULTIPLIER OR K-FACTOR FOR EACH VAV. AFTER CALIBRATION MULTIPLIER IS INPUT INTO THE BMS, RETURN TO VERIFY THE MAX AND VERIFY MIN SETPOINT.·REPORT VAV TERMINAL UNITS THAT ARE ABNORMAL. RECOMMEND INSPECTING FLOW RINGS AND DAMPER INSTALLATIONS.

HYDRONIC BALANCING:

1. ON HW AND CHW VERIFY REQUIRED DP SETPOINT FOR ADEQUATE FLOW TO THE AIR HANDLING UNITS AND VAV COILS. DETERMINE THE DP IN THE LOOP PRESSURE THAT PROVIDES MINIMUM FLOW FOR THE PUMP (APPROXIMATELY 10% FULL FLOW), WHILE ALSO ALLOWING MAXIMUM FLOW THROUGH THE AIR HANDLING UNITS.
2. ON HW AND CHW DETERMINE THE MINIMUM PUMP SPEED TO PROVIDE THE DP AT AWHP, THE WWHP, AND EACH OF THE BOILERS SEE THE CONTROL DECRIPTION OF OPERATIONS FOR ADDITIONAL REQUIREMENTS. NOTE A SEPARATE MINIMUM PUMP SPEED IS EXPECTED TO BE NECESSARY EACH OF THE FOUR MODULES IN THE AWHP.

PLUMBING DHWR BALANCING:

1. BALANCE DOMESTIC HOT WATER SYSTEM INITALLY ADJUSTING CIRCUIT SETTERS TO DESIGN FLOW.
2. BALANCE ALL DOMESTIC HOT WATER RECIRCULATION PUMPS.

TERMINAL SYSTEM BALANCING:

1. ALL LINEAR SLOT DIFFUSERS (AND A FEW MODULAR CORE DIFFUSERS) HAVE A DIRECTIONAL COMPONENT INDICATED ON THE PLANS. VERIFY AND SET DIRECTIONAL COMPONNENTS PRIOR TO AIR BALANCING.
2. THE EXISTING SUPPLY DUCT SYSTEM IS BECOMING THE RETURN AIR SYSTEM. NOTE RETURN AIRFLOW IS LESS THAN THE SUPPLY AIRFLOW TO ACCOUNT FOR PRESSURIZATION OF THE BUILDING. THE EXISTING RETURN DUCT GRILLES MUST BE INDIVIDUALLY BALANCED AT MAX FLOW. WHEN WALLS ARE OPEN ENSURE THAT THE EXISTING DAMPERS ARE FIXED 100% OPEN (OR HAVE BEEN PROPORTIONALLY BALANCED AS RECOMMENDED BY TAB CONTRACTOR) PRIOR TO THEM BECOMING INACCESSIBLE.
3. RETURN AIRFLOW IS LESS THAN THE SUPPLY AIRFLOW TO ACCOUNT FOR PRESSURIZATION OF THE BUILDING IN NEW PORTIONS OF THE BUILDING WHERE INDIVIDUAL SPACES ARE OPEN ABOVE CEILINGS, BALANCING OPENINGS VIA A DUCT TRAVERSE.

REMARKS:
*FOR WIRE SIZING THE HIGHEST LEG DRAW IS SHOWN DUE TO CURRENT IMBALANCE

GENERATORS CONFIGURED TO RECEIVE DI/RO WATER (MECH FLOAT)

ASSUMES INSULATED INTERCONNECTING PIPING FOR LOSS CALCULATION

STEAM PRESSURE GENERATED IS NEAR ATMOSPHERIC (only at several inches of water column)

DRISTEEM 'DRANEKOOLER' REQUIRED TO TEMPER HOTGENERATOR WATER UPON DRAIN CYCLES. A SINGLE DRANEKOOLER CAN TAKE 6GPM & MIXES 1:1 WITH BUILDING SUPPLY WATER. MAX CAPACITY IS 6GPM + 6GPM = 12GPM TO DRAIN
DRANEKOOLER CAN TAKE SEVERAL DRAINS INPUT AS LONG AS COMBINED FLOW DOESN'T EXCEED 6GPM
